DAY 1

1.The intervals and corresponding frequencies are as follows. age frequency

1-5. 200

5-15 450

15-20 300

20-50 1500

50-80 700

80-110 44

Compute an approximate median value for the data

Input:

```
#age, frequency

age<-c(5,15,20,50,80,110)

frequency<-c(200,450,300,1500,700,44)

median(age)

median(frequency)
```

Output:

```
> #age, frequency
> age<-c(5,15,20,50,80,110)
> frequency<-c(200,450,300,1500,700,44)
> median(age)
[1] 35
> median(frequency)
[1] 375
>
```

2.Suppose that the data for analysis includes the attribute age. The age values for the data tuples are (in increasing order) 13, 15, 16, 16, 19, 20, 20, 21, 22, 22, 25, 25, 25, 25, 30, 33, 33, 35, 35, 35, 35, 36, 40, 45, 46, 52, 70.

(a) What is the mean of the data? What is the median?

(b) What is the mode of the data? Comment on the data's modality (i.e., bimodal, trimodal, etc.).

(c) What is the midrange of the data?

(d) Can you find (roughly) the first quartile (Q1) and the third quartile (Q3) of the data?

Input:

#mean,median,mode,quatile

age<-c(13,15,16,16,19,20,20,21,22,22,25,25,25,25,30,33,33,35,35,35,35,36,40,45,46,52,70)

mean(age)

median(age)

mode_age<-names(table(age))[table(age)==max(table(age))]

mode_age

range(age)

quantile(age,.25)

quantile(age,.75)

Output:

```
> #mean,median,mode,quatile
> age<-c(13,15,16,16,19,20,20,21,22,22,25,25,25,25,30,33,33,35,35,35,35,36,40,45,46,52,70)
> mean(age)
[1] 29.96296
> median(age)
[1] 25
> mode_age<-names(table(age))[table(age)==max(table(age))]
> mode_age
[1] "25" "35"
> range(age)
[1] 13 70
> quantile(age,.25)
 25%
20.5
> quantile(age,.75)
75%
 35
```

4.Data:11,13,13,15,15,16,19,20,20,20,21,21,22,23,24,30,40,45,45,45,71,

72,73,75

a) Smoothing by bin mean

b) Smoothing by bin median

c) Smoothing by bin boundaries

input:

```
data <- c(11,13,13,15,15,16,19,20,20,20,21,21,22,23,24,30,40,45,45,45,71,72,73,75)

bins <- 5

bin_indices <- cut(data, bins)

mean_smooth <- tapply(data, bin_indices, mean)

print(mean_smooth)

median_smooth <- tapply(data, bin_indices, median)

median_smooth

min_max_smooth <- tapply(data, bin_indices, function(x) c(min(x), max(x)))

print(min_max_smooth)
```

Output:

```
> data <- c(11,13,13,15,15,16,19,20,20,20,21,21,22,23,24,30,40,45,45,45,71,72,73,75)
> bins <- 5
> bin_indices <- cut(data, bins)
> mean_smooth <- tapply(data, bin_indices, mean)
> print(mean_smooth)
(10.9,23.8] (23.8,36.6] (36.6,49.4] (49.4,62.2] (62.2,75.1]

```

5. Suppose that a hospital tested the age and body fat data for 18 randomly selected adults with the following results:

(a) Calculate the mean, median, and standard deviation of age and %fat.

(b) Draw the boxplots for age and %fat.

(c) Draw a scatter plot and a q-q plot based on these two variables.

Input:

```
age<-c(23,23,27,27,39,41,47,49,50,52,54,54,56,57,58,58,60,61)
```

```
fat<-c(9.5,26.5,7.8,17.8,31.4,25.9,27.4,27.2,31.2,34.6,42.5,28.8,33.4,30.2,34.1,32.9,41.2,35.
7)

mean(age)

median(age)

sd(age)

mean(fat)

median(fat)

sd(fat)

#boxplot

boxplot(age,fat)

#scatter plot

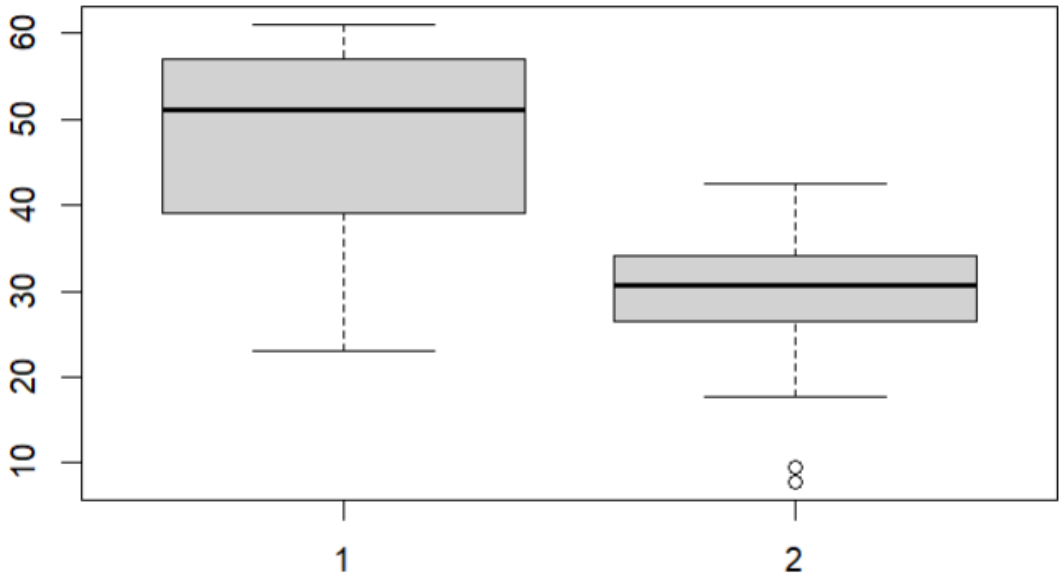
scatter.smooth(age,fat)

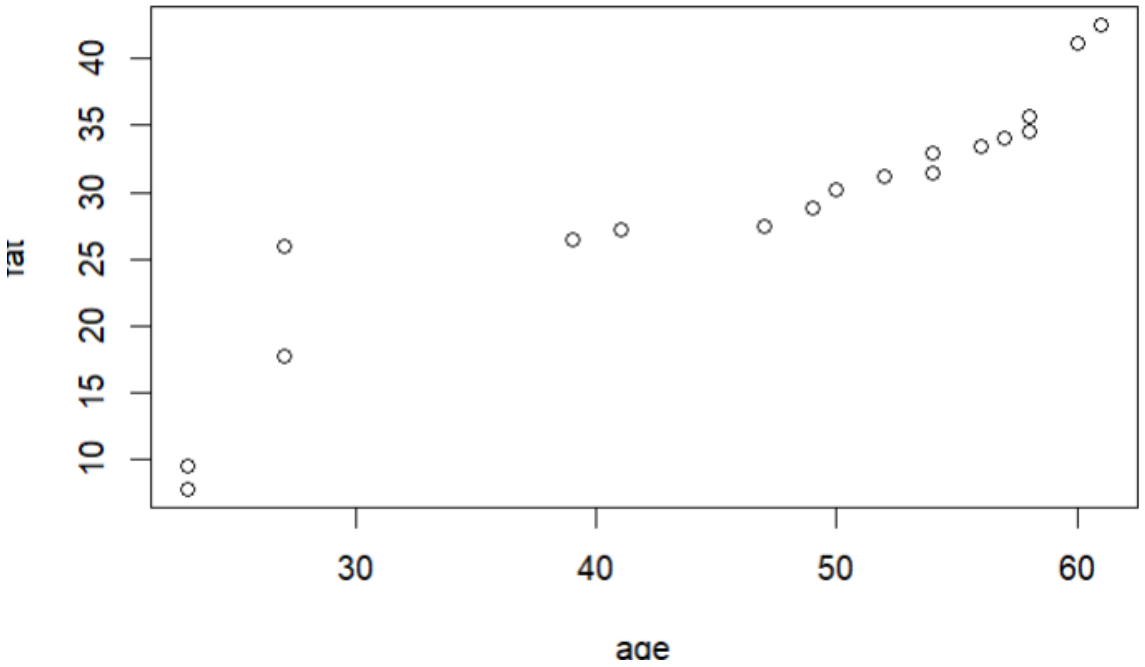
#qplot

qqplot(age,fat)
```

Output:

```
> mean(age)
[1] 46.44444
> median(age)
[1] 51
> sd(age)
[1] 13.21862
> mean(fat)
[1] 28.78333
> median(fat)
[1] 30.7
> sd(fat)
[1] 9.254395
>
```





6.Suppose that a hospital tested the age and body fat data for 18 randomly selected adults with the following results:

(i) Use min-max normalization to transform the value 35 for age onto the range [0.0, 1.0].
(ii) Use z-score normalization to transform the value 35 for age, where the standard deviation of age is 12.94 years.

(iii) Use normalization by decimal scaling to transform the value 35 for age. Perform the above functions using R – tool

Input:

```
v<-c(23,23,27,27,39,41,47,49,50,52,54,54,56,57,58,58,60,61)

min<-0

max<-1

#min_max

min_max=((35-min(v))/(max(v)-min(v)))

print(min_max)

#z-score

m=mean(v)

s<-12.94

z_score=(35-m)/s

print(z_score)

#decimal scaling

m<-35

j=max(m)<1

decimal_scaling=m/10^j

print(decimal_scaling)
```

output:

```
> v<-c(23,23,27,27,39,41,47,49,50,52,54,54,56,57,58,58,60,61)
> min<-0
> max<-1
> #min_max
> min_max=((35-min(v))/(max(v)-min(v)))
> print(min_max)
[1] 0.3157895
> #z-score
> m=mean(v)
> s<-12.94
> z_score=(35-m)/s
> print(z_score)
[1] -0.8844238
> #decimal scaling
> m<-35
> j=max(m)<1
> decimal_scaling=m/10^j
> print(decimal_scaling)
[1] 35
```

7.The following values are the number of pencils available in the different boxes. Create a vector and find out the mean, median and mode values of set of pencils in the given data.

Box1	Box2	Box3	Box4	Box5	Box6	Box7	Box8	Box9	Box 10
9	25	23	12	11	6	7	8	9	10

Input:

```
pencils<-c(9,25,23,12,11,6,7,8,9,10)

mean(pencils)

median(pencils)

mode=names(table(pencils))[table(pencils)==max(table(pencils))]

mode
```

Output:

```
> pencils<-c(9,25,23,12,11,6,7,8,9,10)
> mean(pencils)
[1] 12
> median(pencils)
[1] 9.5
> mode=names(table(pencils))[table(pencils)==max(table(pencils))]
> mode
[1] "9"
```

8. The following table would be plotted as (x,y) points, with the first column being the x values as the number of mobile phones sold and the second column being the y values as money. To use the scatter plot for how many mobile phones sold.

x :4 1 5 7 10 2 50 25 90 36

y :12 5 13 19 31 7 153 72 275 110

input:

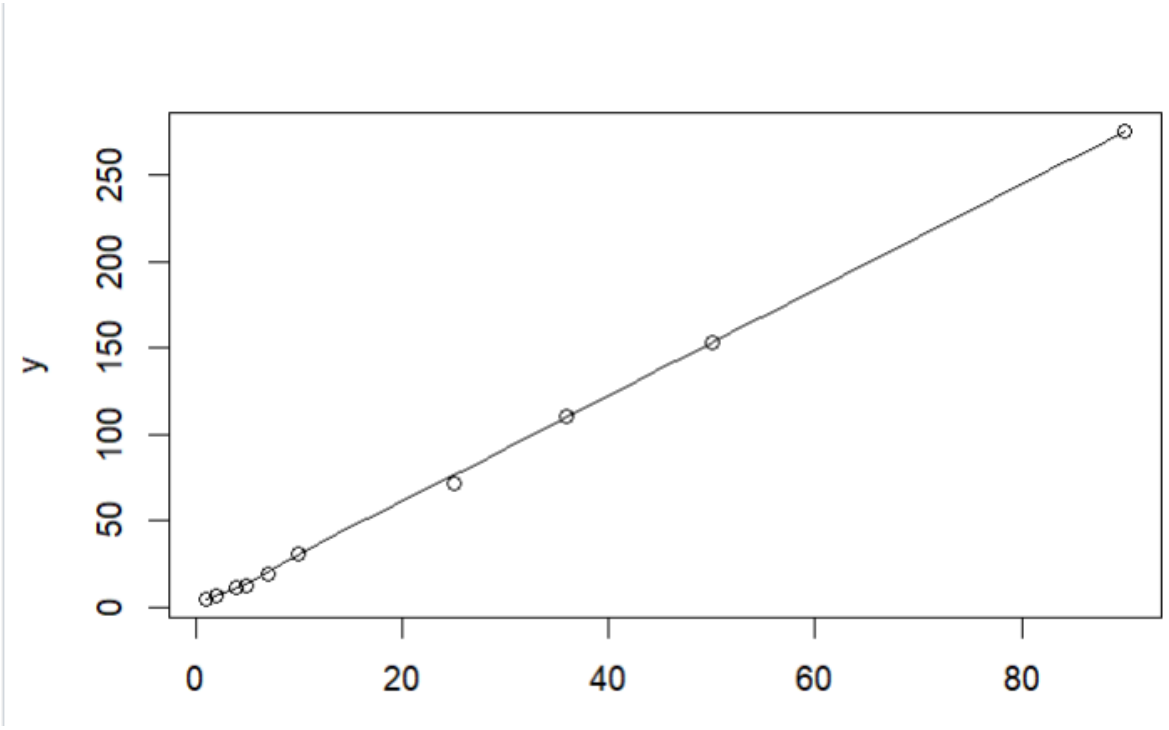
```
#scatterplot

x<-c(4,1,5,7,10,2,50,25,90,36)

y<-c(12,5,13,19,31,7,153,72,275,110)

scatter.smooth(x,y)
```

Output:



9. Implementing the R script using marks scored by a student in his model exam has been sorted as follows: 55, 60, 71, 63, 55, 65, 50, 55,58,59,61,63,65,67,71,72,75. Partition them into three bins by each of the following methods. Plot the data points using histogram.

(a) equal-frequency (equi-depth) partitioning (b) equal-width partitioning

Input:

```
marks <- c(55, 60, 71, 63, 55, 65, 50, 55, 58, 59, 61, 63, 65, 67, 71, 72, 75)

num_bins <- 3

```

13.Imagine that you have selected data from the All Electronics data warehouse for analysis. The data set will be huge! The following data are a list of All Electronics prices for commonly sold items (rounded to the nearest dollar). The numbers have been sorted: 1, 1, 5, 5, 5, 5, 5, 8, 8, 10, 10, 10, 10, 12, 14, 14, 14, 15, 15, 15, 15, 15, 15, 18, 18, 18, 18, 18,

Input:

Given data

prices <- c(1, 1, 5, 5, 5, 5, 5, 8, 8, 10, 10, 10, 10, 12, 14, 14, 14, 15, 15, 15, 15, 15, 15, 18, 18, 18, 18, 18, 18, 18, 18, 20, 20, 20, 20, 20, 20, 20, 21, 21, 21, 21, 25, 25, 25, 25, 25, 28, 28, 30, 30, 30)

(i) Equal-frequency partitioning with bin equal to 3

equal_freq_bins <- cut(prices, breaks = 3, labels = FALSE)

cat("(i) Equal-frequency partitioning bins:\n", equal_freq_bins, "\n")

18, 18, 18, 20, 20, 20, 20, 20, 20, 20, 21, 21, 21, 21, 25, 25, 25, 25, 25, 28, 28, 30,

30, 30.

(i) Partition the dataset using an equal-frequency partitioning method with bin equal to 3 (ii) apply data

smoothing using bin means and bin boundary.

(iii) Plot Histogram for the above frequency division

```
# (ii) Data smoothing using bin means and bin boundary

bin_means <- tapply(prices, equal_freq_bins, mean)

bin_boundaries <- unique(cut(prices, breaks = 3, labels = FALSE, include.lowest = TRUE))

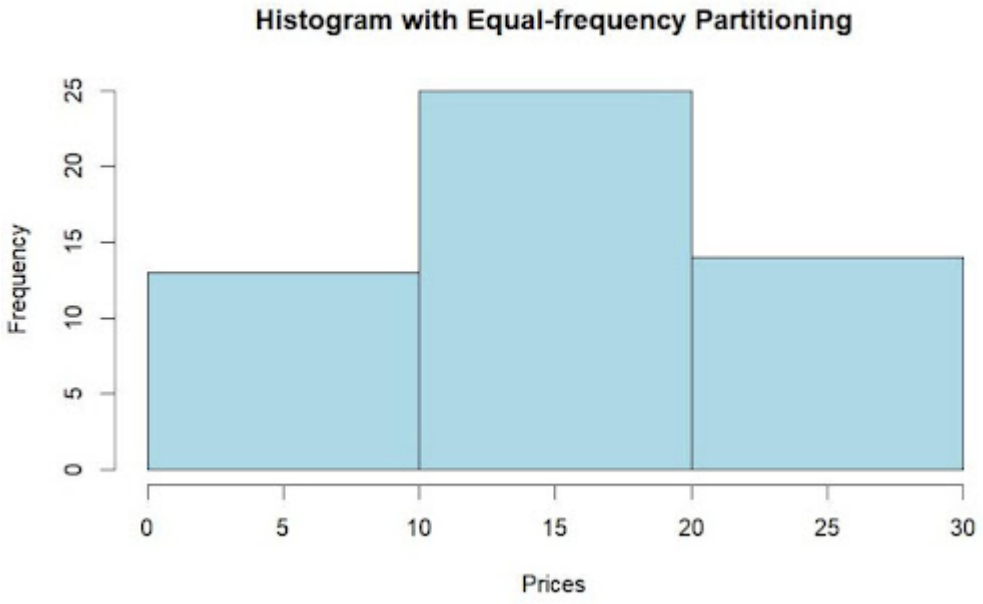
cat("(ii) Bin Means:\n", bin_means, "\n")

cat("Bin Boundaries:\n", bin_boundaries, "\n")

# (iii) Plot Histogram

hist(prices, breaks = 3, main = "Histogram with Equal-frequency Partitioning", xlab = "Prices", col = "lightblue", border = "black")
```

Output:



14.Two Maths teachers are comparing how their Year 9 classes performed in the end of year exams. Their results are as follows: Class A: 76, 35, 47, 64, 95, 66, 89, 36, 8476,35,47,64,95,66,89,36,84

Class B: 51, 56, 84, 60, 59, 70, 63, 66, 5051,56,84,60,59,70,63,66,50

(i) Find which class had scored higher mean, median and range. (ii) Plot above in boxplot and give the inferences.

INPUT:

```
classA <- c(76, 35, 47, 64, 95, 66, 89, 36, 84)

classB <- c(51, 56, 84, 60, 59, 70, 63, 66, 50)

meanA <- mean(classA)

meanB <- mean(classB)

medianA <- median(classA)

medianB <- median(classB)

rangeA <- range(classA)

rangeB <- range(classB)

cat("(i) Class A vs Class B:\n")

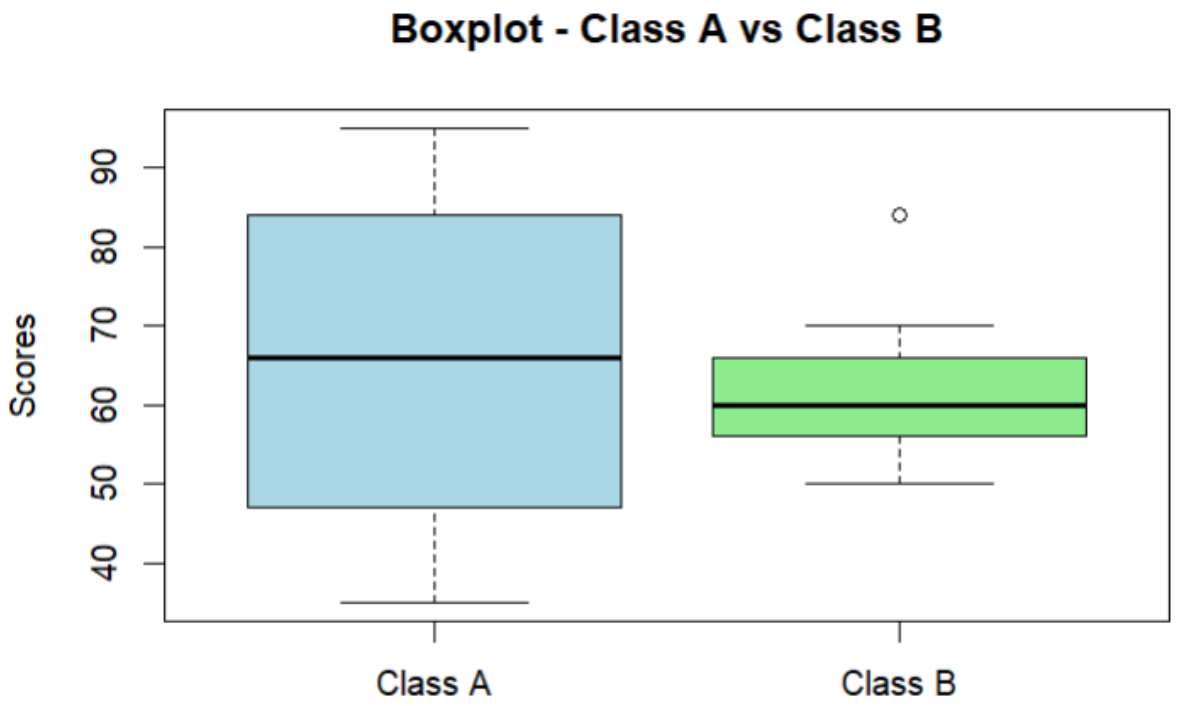
> medianB <- median(classB)
> rangeA <- range(classA)
> rangeB <- range(classB)
> cat("(i) Class A vs Class B:\n")
(i) Class A vs Class B:
> cat("Mean: Class A -", meanA, " Class B -", meanB, "\n")
Mean: Class A - 65.77778  Class B - 62.11111
> cat("Median: Class A -", medianA, " Class B -", medianB, "\n")
Median: Class A - 66  Class B - 60
> cat("Range: Class A -", diff(rangeA), " Class B -", diff(rangeB), "\n")
Range: Class A - 60  Class B - 34
> boxplot(classA, classB, names = c("Class A", "Class B"), col = c("lightblue", "lightgreen"), main = "Boxplot
- Class A vs Class B", ylab = "Scores")
> cat("(ii) Inferences from Boxplot:\n")
(ii) Inferences from Boxplot:
> cat(" - Class A has a wider range of scores compared to Class B.\n")
 - Class A has a wider range of scores compared to Class B.
> cat(" - The median score for Class A is higher than that for Class B.\n")
 - The median score for Class A is higher than that for Class B.
> cat(" - Class A has an outlier which affects the mean.\n")
 - Class A has an outlier which affects the mean.
```



15.Let us consider one example to make the calculation method clear. Assume that the minimum and maximum values for the feature F are $50,000 and $100,000 correspondingly. It needs to range F from 0 to 1. In accordance with min-max normalization, v = $80,

b) Use the two methods below to normalize the following group of data: 200, 300, 400, 600, 1000

(a) min-max normalization by setting min = 0 and max = 1

(b) z-score normalization

Input:

```
data <- c(200, 300, 400, 600, 1000)

min_max_custom <- function(x, min_val, max_val) {

return (x - min_val) / (max_val - min_val)

}

min_max_normalized_custom <- min_max_custom(data, 200, 1000)

min_max_normalized_default <- scale(data, center = min(data), scale = diff(range(data)))

z_score_normalized <- scale(data)

cat("Original Data: ", data, "\n\n")

cat("(a) Min-Max normalization with custom min and max values:\n")

cat("Normalized Data: ", min_max_normalized_custom, "\n\n")

cat("(b) Min-Max normalization with min = 0 and max = 1:\n")

cat("Normalized Data: ", min_max_normalized_default, "\n\n")

cat("(c) Z-score normalization:\n")

cat("Normalized Data: ", z_score_normalized, "\n")
```

output:

```
> data <- c(200, 300, 400, 600, 1000)
> min_max_custom <- function(x, min_val, max_val)
+ {
+   return (x - min_val) / (max_val - min_val)
+ }
> min_max_normalized_custom <- min_max_custom(data, 200, 1000)
> min_max_normalized_default <- scale(data, center = min(data), scale = diff(range(data)))
> z_score_normalized <- scale(data)
> cat("Original Data: ", data, "\n\n")
Original Data:  200 300 400 600 1000

> cat("(a) Min-Max normalization with custom min and max values:\n")
(a) Min-Max normalization with custom min and max values:
> cat("Normalized Data: ", min_max_normalized_custom, "\n\n")
Normalized Data:  0 100 200 400 800

> cat("(b) Min-Max normalization with min = 0 and max = 1:\n")
(b) Min-Max normalization with min = 0 and max = 1:
> cat("Normalized Data: ", min_max_normalized_default, "\n\n")
Normalized Data:  0 0.125 0.25 0.5 1

> cat("(c) Z-score normalization:\n")

```

16.Make a histogram for the “AirPassengers “dataset, start at 100 on the x-axis, and from values 200 to 700, make the bins 150 wide

Input:

```
data("AirPassengers")

start_value <- 100

bin_width <- 150

bin_breaks <- seq(start_value, 700, by = bin_width)

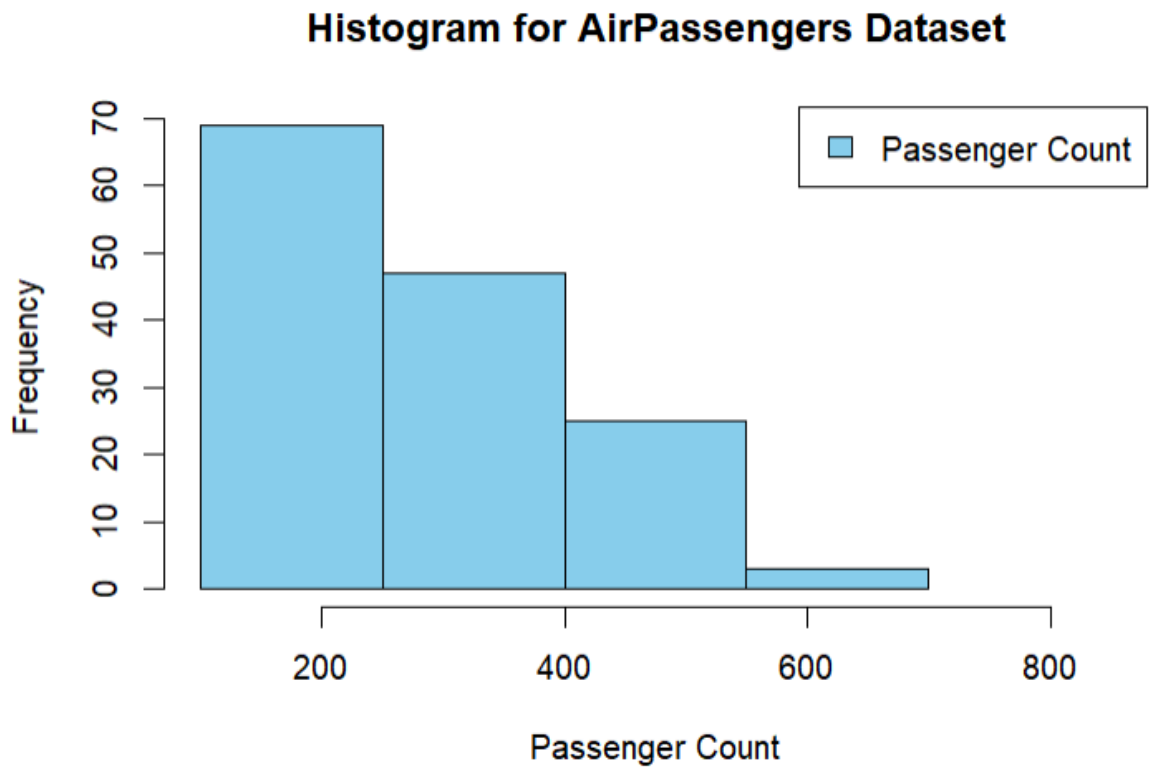
hist(AirPassengers, breaks = bin_breaks, xlim = c(start_value, max(bin_breaks) +
bin_width),

main = "Histogram for AirPassengers Dataset",

xlab = "Passenger Count", ylab = "Frequency", col = "skyblue", border = "black")

legend("topright", legend = c("Passenger Count"), fill = c("skyblue"))
```

OUTPUT:



17.Obtain Multiple Lines in Line Chart using a single Plot Function in R.Use attributes“mpg”and“qsec”of the dataset “mtcars”

INPUT

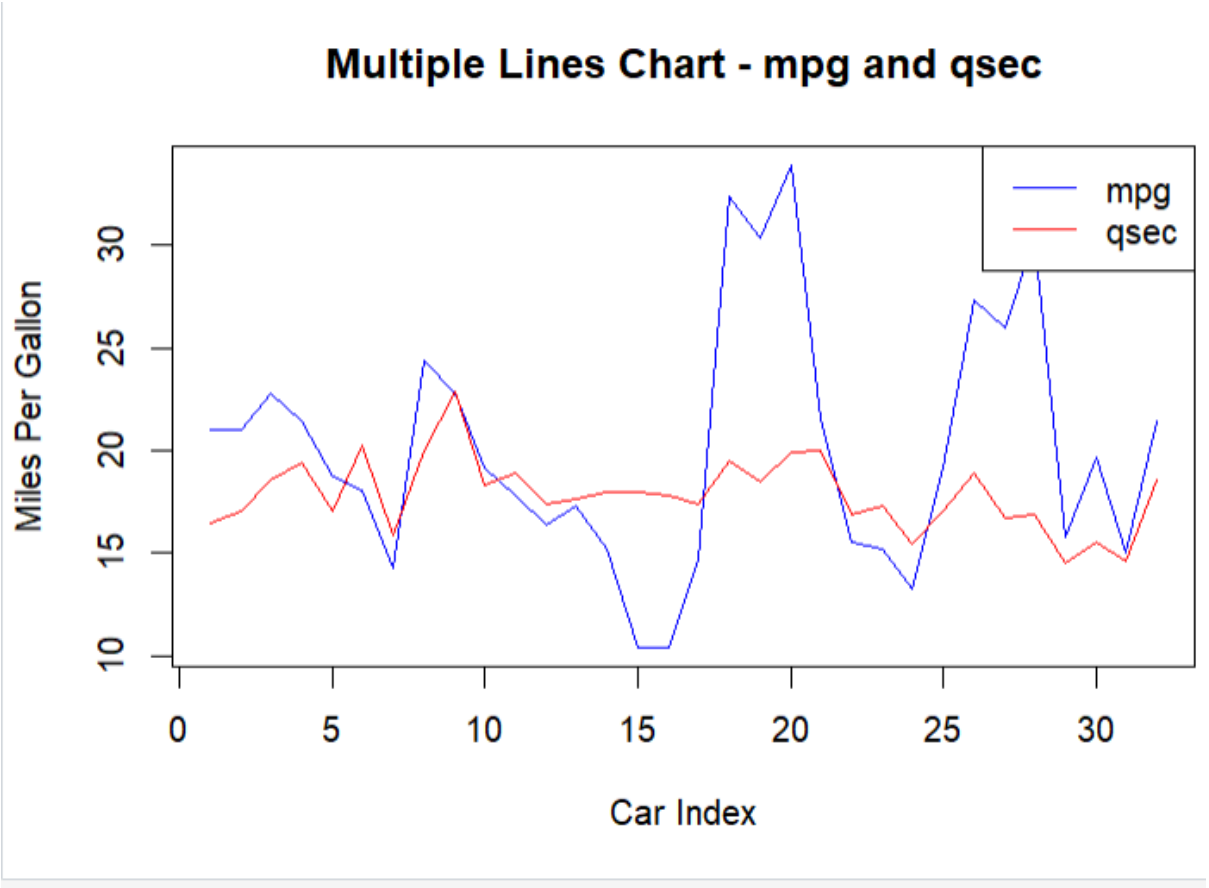
```
data(mtcars)

plot(mtcars$mpg, type = "l", col = "blue", xlab = "Car Index", ylab = "Miles Per Gallon", main = "Multiple Lines Chart - mpg and qsec")

lines(mtcars$qsec, col = "red")

legend("topright", legend = c("mpg", "qsec"), col = c("blue", "red"), lty = 1)
```

OUTPUT



18.Download the Dataset "water" From R dataset Link.Find out whether there is a linear relation between attributes"mortality" and"hardness" by plot function.Fit the Data into the Linear Regression model.Predict the mortality for the hardness==88.

INPUT

```
data(mtcars)

mortality <- mtcars$mpg

hardness <- mtcars$hp

plot(hardness, mortality, main = "Linear Regression: Mortality vs. Hardness",

xlab = "Hardness", ylab = "Mortality", pch = 16, col = "blue")

linear_model <- lm(mortality ~ hardness)

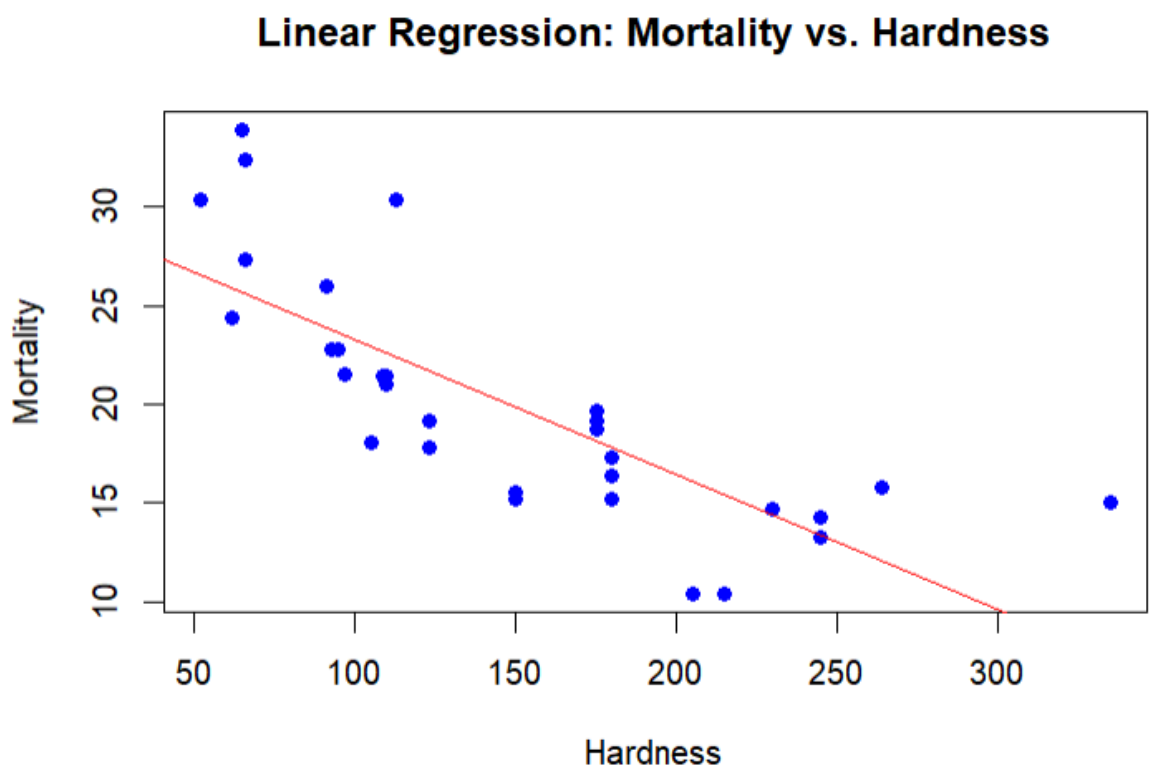
abline(linear_model, col = "red")

new_data <- data.frame(hardness = 88)

predicted_mortality <- predict(linear_model, newdata = new_data)

cat("Predicted Mortality for Hardness=88:", predicted_mortality, "\n")
```

Output:

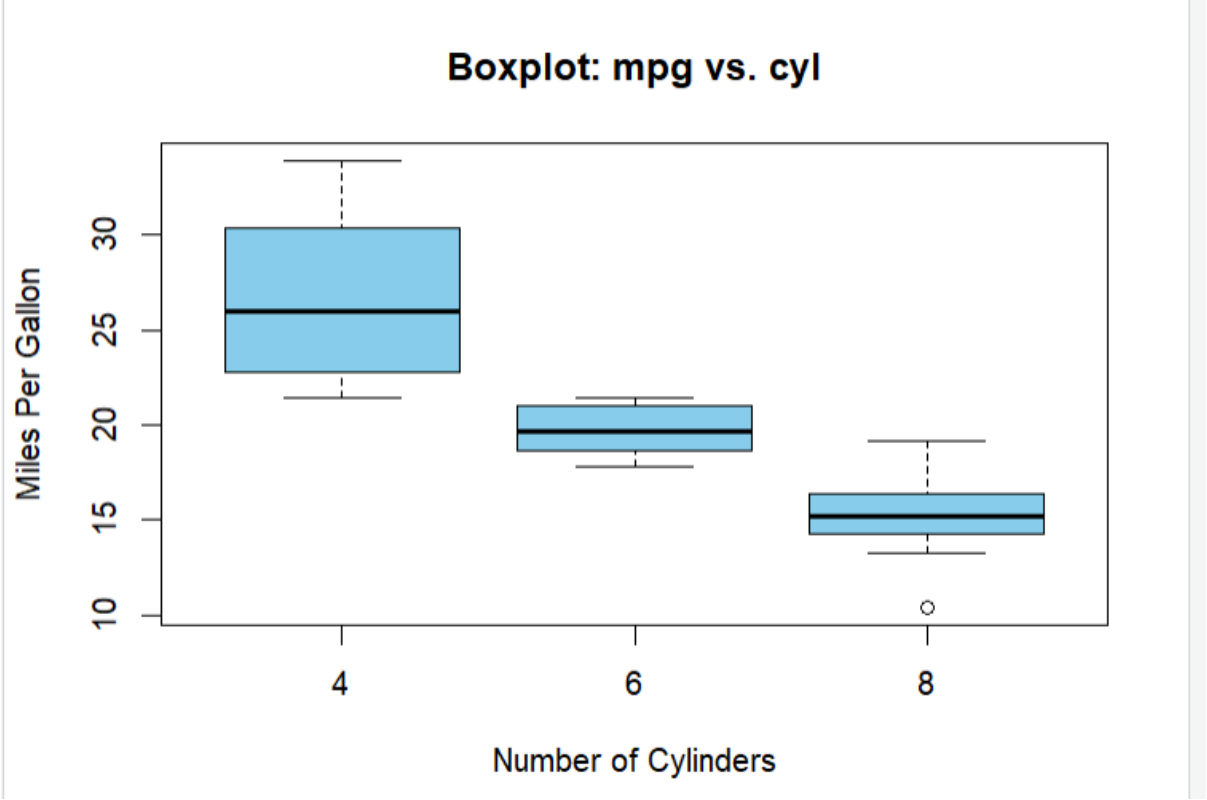


19.Create a Boxplot graph for the relation between "mpg"(miles per galloon) and "cyl"(number of Cylinders) for the dataset "mtcars" available in R Environment.

Input:

```
data(mtcars)
boxplot(mpg ~ cyl, data = mtcars, main = "Boxplot: mpg vs. cyl",
xlab = "Number of Cylinders", ylab = "Miles Per Gallon", col = "skyblue")
```

OUTPUT



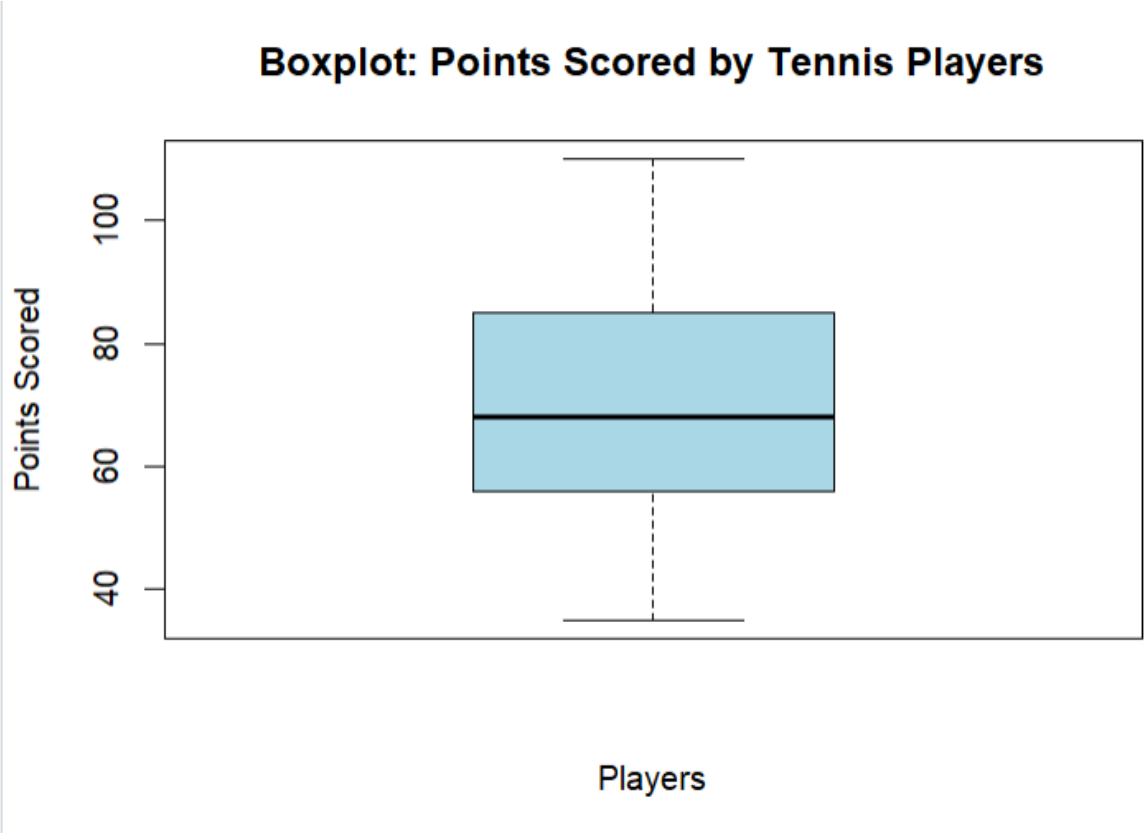
20. Assume the Tennis coach wants to determine if any of his team players are scoring outliers. To visualize the distribution of points scored by his players, then how can he decide to develop the box plot? Give suitable example using Boxplot visualization technique.

Input:

```
points_scored <- c(35, 42, 48, 52, 56, 60, 62, 65, 68, 72, 76, 80, 85, 88, 92, 100, 110)
boxplot(points_scored, main = "Boxplot: Points Scored by Tennis Players",
```

xlab = "Players", ylab = "Points Scored", col = "lightblue", border = "black")

OUTPUT



21. Implement using R language in which age group of people are affected by blood pressure based on the diabetes dataset show it using scatter plot and bar chart (that is BloodPressure vs Age using dataset "diabetes.csv")

Input:

```
# Sample data (assuming the structure of your dataset)

data <- data.frame(

  Age = c(25, 30, 35, 40, 45, 50, 55, 60, 65, 70),

  BloodPressure = c(120, 130, 140, 150, 135, 145, 155, 160, 150, 140)

)

# Scatterplot

plot(data$Age, data$BloodPressure, main = "Blood Pressure vs Age", xlab = "Age", ylab = "Blood Pressure", pch = 16, col = "blue")

# Bar chart
```

barplot(data$BloodPressure, names.arg = data$Age, main = "Blood Pressure vs Age", xlab = "Age", ylab = "Blood Pressure", col = "green", border = "black")

Output:

DAY4

05/03/2024

1.Consider that you are owning a supermarket mall and through membership cards, you have some basic data about your customers like Customer ID, age, gender, annual income and spending score. For the above scenario, the Problem Statement was You want to understand the customers who can easily converge [Target Customers] so that the data can be given to the marketing team and plan the strategy accordingly. For the above scenario prepare a dataset and perform **Clustering Analysis** to segment the customers in the Mall. There are clearly Five segments of Customers based on their Annual Income and Spending Score namely *Usual Customers, Priority Customers, Senior Citizen Target Customers, and Young Target Customers.*Sample data

	CustomerID	Gender	Age	Annual Income (k$)	Spending Score (1-100)
0	1	Male	19	15	39
1	2	Male	21	15	81
2	3	Female	20	16	6
3	4	Female	23	16	77
4	5	Female	31	17	40

Input:

@relation dataset

@attribute customerid{1,2,3,4,5}

@attribute gender{male,female}

@attribute age{19,21,20,23,31}

@attribute income{15,16,17}

@attribute score{usual,priority,senior,young}

@data

1 male 19 15 usual

2 male 21 15 priority

3 female 20 16 young

4 female 23 16 priority

5 female 31 17 senior

Output:

```
kMeans

grid()

6.Generate rules using FP growth algorithm using the given dataset which has the following transactions with items purchased: Consider the values as support=50% and confidence=75%.

Transaction ID	Items Purchased
1	Bread, Cheese, Egg, Juice
2	Bread, Cheese, Juice
3	Bread, Milk, Yogurt
4	Bread, Juice, Milk
5	Cheese, Juice, Milk

Input:

@relation dataset

@attribute transid{1,2,3,4,5}

@attribute bread{true,false}

@attribute cheese{true,false}

@attribute egg{true,false}

@attribute juice{true,false}

@attribute milk{true,false}

@attribute yoghourt{true,false}

@data

1,true,true,true,true,false,false

2,true,true,false,true,false,false

3,true,false,false,false,true,true

4,true,false,false,true,true,false

5,false,true,false,true,true,false

7.Prediction of Diabetes Data using Decision tree classifier in WEKA. Compare it with Support Vector Machine classifier. Show the result accuracy and F1 measure calculation .Plot the graph and explain the summary of results.

8.Implement of the R script using marks scored by a student in his model exam has been sorted as follows: 55, 60, 71, 63, 55, 65, 50, 55,58,59,61,63,65,67,71,72,75. Partition them into three bins by each of the following methods. Plot the data points using histogram.

(a) equal-frequency (equi-depth) partitioning

(b) equal-width partitioning

(c) clustering

Input:

marks <- c(55, 60, 71, 63, 55, 65, 50, 55, 58, 59, 61, 63, 65,

```
bins_a <- cut(marks, breaks = 3, labels = c("Low", "Medium", "High"))

bins_b <- cut(marks, breaks = seq(min(marks), max(marks), length.out = 4), labels =
c("Low", "Medium", "High"))

k <- 3

clusters <- kmeans(matrix(marks), centres = k)

bins_c <- cut(clusters$centers[clusters$cluster], breaks = 3, labels = c("Low", "Medium",
"High"))

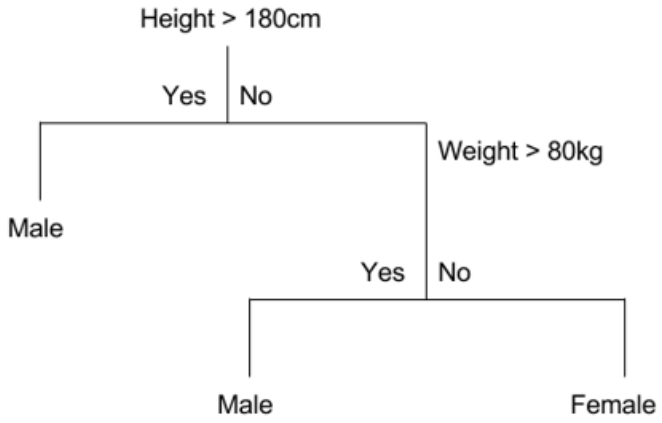
par(mfrow = c(1, 3))

hist(marks, main = "Equal-frequency (equi-depth) partitioning", col = "skyblue", breaks = 3)

hist(marks, main = "Equal-width partitioning", col = "light green", breaks = seq(min(marks),
max(marks), length.out = 4))

hist(marks, main = "Clustering", col = "light pink", breaks = 3)
```

9.Consider this Decision tree :
a)create the data set for the below tree using ARFF format and calculate accuracy and decision for the same
b) Using this decision tree generates the rules based on rule based induction.
c) Compare both the algorithms and plot the confusion matrix.



10.Create an ARFF file for the table below and implement for the Apriori Algorithm and FP growth algorithm and compare the rules generated by both the algorithms. Identify the unique rules generated by the above algorithms.

NOTE: Assume Min_sup=2 and confidence= 50%

T.ID	ITEMS
T1	SONY, BPL, LG
T2	BPL, SAMSUNG
T3	BPL, ONIDA
T4	SONY, BPL, SAMSUNG
T5	SONY, ONIDA
T6	BPL, ONIDA
T7	SONY, ONIDA
T8	SONY, BPL, ONIDA, LG
T9	SONY, BPL, ONIDA

Input:

@relation dataset

@attribute id{1,2,3,4,5,6,7,8,9}

@attribute sony{true,false}

@attribute bpl{true,false}

@attribute lg{true,false}

@attribute samsung{true,false}

@attribute onida{true,false}

9,true,true,false,false,true

11,. The given are the strike-rates scored by a batsman in season 1 in different tournaments.
100, 70, 60, 90, 90

(a) min-max normalisation by setting min = 0 and max = 1
(b) z-score normalisation
(c) z-score normalisation using the mean absolute deviation instead of standard deviation
(d) normalisation by decimal scaling

Input:

```
strike_rates <- c(100, 70, 60, 90, 90)

min_max_normalization <- function(x) {

(x - min(x)) / (max(x) - min(x))

}

normalized_min_max <- min_max_normalization(strike_rates)

z_score_normalization <- function(x) {

(x - mean(x)) / sd(x)

}

normalized_z_score <- z_score_normalization(strike_rates)

mad_normalization <- function(x) {

(x - mean(x)) / mad(x)

}

normalized_mad <- mad_normalization(strike_rates)

decimal_scaling_normalization <- function(x) {

x / 10^(ceiling(log10(max(x))))

}

normalized_decimal_scaling <- decimal_scaling_normalization(strike_rates)

cat("Original Data:", strike_rates, "\n\n")

cat("(a) Min-Max Normalization:", normalized_min_max, "\n")
```

```
cat("(b) Z-Score Normalization:", normalized_z_score, "\n")

cat("(c) Z-Score Normalization (MAD):", normalized_mad, "\n")

cat("(d) Normalization by Decimal Scaling:", normalized_decimal_scaling, "\n")
```

12.Suppose some car is tested for the AvgSpeed and TotalTime data for 9 randomly selected car with the following result

AvgSpeed (in kph)	**78**	**81**	**82**	**74**	**83**	**82**	**77**	**80**	**70**
TotalTime (in mins)	**39**	**37**	**36**	**42**	**35**	**36**	**40**	**38**	**46**

a) Calculate the standard deviation of AvgSpeed and TotalTime.

b) Calculate the Variance of AvgSpeed and TotalTime for the above dataset.

Input:

```
avg_speed <- c(78, 81, 82, 74, 83, 82, 77, 80, 70)

total_time <- c(39, 37, 36, 42, 35, 36, 40, 38, 46)

sd_avg_speed <- sd(avg_speed)

sd_total_time <- sd(total_time)

var_avg_speed <- var(avg_speed)

var_total_time <- var(total_time)

cat("Standard Deviation of AvgSpeed:", sd_avg_speed, "\n")

cat("Standard Deviation of TotalTime:", sd_total_time, "\n\n")

cat("Variance of AvgSpeed:", var_avg_speed, "\n")

cat("Variance of TotalTime:", var_total_time, "\n")
```

13. Consider the table

	TID	items bought
c)	**T100**	**{M, O, N, K, E, Y}**
d)	**T200**	**{D, O, N, K, E, Y }**
e)	**T300**	**{M, A, K, E}**
f)	**T400**	**{M, U, C, K, Y}**
g)	**T500**	**{C, O, O, K, I ,E}**

h) (a) Find all frequent item set using Apriori and FP-growth, respectively. Compare the efficiency of the two mining processes.

i) (b) List all of the strong association rules (with support s and confidence c) matching the following metarule, where X is a variable representing customers, and itemi denotes variables representing items (e.g., "A", "B", etc.):

j) $\forall x \in$ transaction, buys(X, item1) $\wedge$ buys(X, item2) $\Rightarrow$ buys(X, item3)

Input:

@relation dataset

@attribute M{true,false}

@attribute O{true,false}

@attribute N{true,false}

@attribute K{true,false}

@attribute E{true,false}

@attribute Y{true,false}
